

Read the PDF and extract the last sentence of the paragraph from the PDF

Raw Data when Read File is run:

The screenshot shows the Langflow application interface. A 'Component Output' dialog box is open, displaying the following text:

Inspect the output of the component below.

This is a sample paragraph included in a PDF document for text extraction testing. The content is rendered as actual PDF text rather than an image, so OCR is not required. Users can extract this text using common PDF readers, text extraction libraries, or document processing tools. The purpose of this file is to verify that text remains searchable and selectable even when a background image is present on the page.

The dialog box has tabs for 'Outputs' and 'Logs', and a 'Close' button at the bottom right. The background interface includes a search bar with the text 'text', a list of components (Input & Output, Processing, Parser, Split Text, Text Operations, LLM Operations, Guardrails), and a project title 'Extract-PDF-GenAI-Shalini'.

Prompt Template to extract the Last Sentence

Edit Prompt

Answer the user's request based on the document below:

{input}

Instructions:

1. Read the entire document content.
2. Identify all complete sentences in the document.
3. Extract ONLY the final sentence appearing in the document.
4. Do NOT summarize, explain, rephrase, or modify the sentence.
5. Do NOT return any other text from the document.
6. Ignore headings, metadata, page numbers, and formatting.
7. If no sentence is found, return:
"Last sentence not found."

Output Format:

Last Sentence is: <last_sentence>

Prompt Variables: {input}

Prompt variables can be created with any chosen name inside curly brackets, e.g. {variable_name}
